In Kenya, MADRE and Indigenous Information Network (IIN) work to advance Indigenous women’s solutions to climate change in local communities.

**Rainwater Harvesting**
We installed 50 water tanks to provide clean water to 5000 people.

**Alternative Energy**
We distributed over 100 energy-efficient jiko stoves, an updated Indigenous design that uses 80% less wood than conventional cooking.

**Conservation Farming**
We supported drought-resistant crops so women can feed their families.

**Traditional Knowledge**
We support exchanges between women traditional knowledge holders to learn from each other and preserve and produce knowledge needed to adapt to climate change.

**Reforestation**
We delivered training and 50,000 tree seedlings to women farmers to renew forests and protect local water sources from erosion and contamination.

**Indigenous Women in Climate Policy**
We support the participation of Indigenous women to influence local, regional and international climate policy. Because women on the frontlines of climate change should be the ones setting the agenda.
